

ABSTRACT

The present invention provides an exposure method and exposure apparatus that enable the effects on an apparatus main body of heat generated by a control system to be suppressed when an error occurs in an air-conditioning system or temperature control system. In the exposure apparatus of the present invention, if an error occurs in an air-conditioning system (50) that air-conditions an interior of a chamber (11 to 16) in which an exposure body section (STP) is housed or occurs in a temperature control system (52) that controls a temperature of the exposure body section (STP), a power supply of a control system (53 to 56) that controls the exposure body section (STP) is shut down.
